

How Qreek actually operates

A working reference for how each product surface functions, what Qreek charges and why, who really moves the money, and what's still behind the scenes — so copy, campaigns, and support answers stay accurate to what's shipped.

● POSITIONING

What Qreek is

Qreek is a payment layer built for how Nigerians actually collect and move money — ajo and esusu circles, church and community levies, family support, solo traders and freelancers, and company payroll — all on a shared, receipted ledger instead of a notebook or a WhatsApp thread.

Qreek doesn't hold or move money itself. Every naira is processed by **Flutterwave**, a CBN-licensed Payment Solution Provider; Qreek is the collection, ledger, and reconciliation layer on top. That distinction matters for every claim in this document — it's why Qreek can say "your money never sits with us."

Payment Pools

Group money with a live ledger — ajo, esusu, church funds, cooperative dues. Built for a group collecting together, where everyone needs to see who's paid.

- 01 A member creates a pool and gets a 6-character invite code, shareable in a WhatsApp group.
- 02 The pool admin posts a contribution request; every member sees it and pays through Flutterwave checkout — card, bank transfer, or USSD.
- 03 Each payment lands on an activity feed visible to all members in real time: who paid, how much, when.
- 04 Members can also request payouts from the pool balance to an external bank account, gated behind their transaction PIN.

Roles and admin handover are supported, and members can flag a disputed transaction for the group to see — the pool is meant to replace the trust problem of a notebook, not just digitize the collection step.

Qreek's cut **0.15%** per contribution

Payment Links

One link, for one person or business collecting on their own — an invoice you can share anywhere. Built for a solo trader or freelancer, not a group.

- 01 Set a title, an amount (or leave it flexible), and the destination bank account — verified against Flutterwave before the link goes live.
- 02 Share the link on WhatsApp, Instagram, anywhere. The payer opens it in a browser — no Qreek account required.
- 03 They pay through Flutterwave's secure checkout; the link owner gets instant confirmation and an automatic record, no bank-alert screenshotting.

A personal link is **created once per user and edited in place** — a user can't spin up a second active personal link. That's a deliberate constraint: the link's code stays stable, so a client who's paid it before can trust it's the same one, and it can't be quietly duplicated or spoofed.

Qreek's cut **0.25%** per payment

Enterprise Payroll

Batch salary disbursement for organizations — built to pay a whole roster in one confirmed action instead of one bank transfer at a time.

01

A company registers a profile to unlock payroll, then imports its employee roster via CSV, organized by department.

02

Admins preview a payroll run — every salary, any one-off overrides, and the total cost including Qreek's fee — before anything moves.

03

Execution requires the admin's transaction PIN. The company's NGN balance is debited once, and payouts fire to every employee's bank account in parallel.

04

Each employee's payout status updates live — pending, processing, completed, or failed — with a full audit log and department-level spend analytics after the fact.

Qreek's cut **0.2%** per payroll run

Marketing note: the payroll API is fully built and is what powers the landing page's "pay 500 employees in 4 minutes" claim — but on the live site, the `/enterprise` pages currently render a "coming soon" placeholder rather than the real setup flow. Treat self-serve payroll signup as pre-launch until product confirms the gate is lifted; company onboarding today runs through direct/invite links (see `/invite/:company/:token`), not public signup.

Family

A shared ledger for a family unit — support requests, transfers between members, and a public intake link for contributions (school fees, medical support, a relative's upkeep).

Family reuses the same checkout rail as Payment Links for intake, but keeps its own request and transfer records, distinct from a Pool. It's a live, routed feature on the web app today — but it isn't yet on the public landing page as a named pillar the way Pools, Links, and Payroll are. That's a gap, not a launch decision: worth flagging to product if it should get its own marketing treatment.

Qreek's cut **0.15%** per contribution (same rate as Pools)

How money actually moves

This is the part worth getting precisely right in any external claim — it's also Qreek's strongest trust story.

Flutterwave processes everything

Every card, transfer, and USSD payment runs through Flutterwave, a CBN-licensed Payment Solution Provider. Qreek is not the licensed entity — it's the ledger and collection layer built on top.

Nothing charges silently

No deduction happens unless Flutterwave confirms the charge succeeded. The full cost — Qreek's fee and Flutterwave's own processing fee — is shown before the payer confirms.

Qreek never custodies funds

Money moves directly from the payer's card or bank to the recipient's account. Qreek's fee is carved out automatically at the moment of settlement, via a split on Flutterwave's side — it's never held separately.

Stuck payments self-heal

If a payment shows pending, Qreek re-checks with Flutterwave in the background until it resolves. Payers and recipients don't have to chase it manually.

Accounts, guests & saved cards

Paying doesn't require an account. Anyone can pay a Pool contribution or a Payment Link as a guest — name, phone number, then card, transfer, or USSD. An account is only needed to create pools, links, or payroll runs, or to save a card for one-tap checkout next time.

Creating an account is phone-number-first: a phone number, a name, and a 4–6 digit transaction PIN — no forms, no branch visit, no waiting on approval. That PIN is required again to authorize anything that moves money out (payroll runs, pool payouts, sends). Five wrong PIN attempts freezes the account; recovery runs through a 6-digit SMS code, valid for 10 minutes.

Saved cards never touch Qreek's servers — a successful Flutterwave charge can leave behind a secure token, and that token is all Qreek ever stores. A returning guest can pull up a saved card by entering the phone number it's tied to and confirming a one-time SMS code — no password, no full login. Some banks still require their own second one-time code per charge, even on a saved card; that's a card-network rule, not a Qreek or Flutterwave limitation.

Full fee table

The one table to check before any pricing claim goes out. No monthly fee, no setup fee, on any surface.

SURFACE	QREEK'S FEE	BASIS
Payment Pools	0.15%	Per contribution, paid by the member
Family	0.15%	Per contribution to a family intake link
Payment Links	0.25%	Per payment received through a personal link
Enterprise Payroll	0.2%	Per salary disbursed in a payroll run
Monthly / setup	NO	No subscription, no onboarding cost, no lock-in

Flutterwave's own processing fee is separate from all of the above, and is always itemized on the checkout screen before the payer confirms — it is not a hidden markup, and it is not Qreek's revenue.

● COMMUNICATION

Notifications

SMS is the primary channel end users actually see: OTP codes for sign-up recovery and passwordless saved-card checkout, a "you've been paid" alert to a link or pool owner the moment a contribution lands, and a payment receipt back to the payer once Flutterwave confirms. There's no email or push notification layer today — anything promising an email receipt or app push should be checked against this before it ships.

● NOT CUSTOMER-FACING

Internal tooling

There's a separate admin panel (its own frontend, not the customer site) that Qreek staff use to oversee companies, pools, links, transactions, and users. It's operational infrastructure, not a product to reference in customer-facing marketing — mentioned here only so it doesn't get confused with a customer "dashboard" feature.

What's not public yet

Things that exist in Qreek's backend but aren't part of the current product story — don't promise these without checking with product first.

A conversational, AI-driven assistant

Qreek's backend includes a natural-language layer ("Qreek Finance") that can interpret chat messages into actions — buying, selling, and sending crypto, cross-chain bridging, watchlist price alerts, and joining crypto-denominated pools — originally built for a WhatsApp-first experience. It shares its session state with a web chat socket, so the capability is live under the hood, but it predates the current NGN-first, ajo/esusu/payroll positioning and doesn't appear anywhere on today's site. Treat crypto trading as a dormant capability, not a current offering.

Compiled from the Qreek web and admin codebases — reflects what's shipped, not the roadmap. Flag anything that reads stale.
